The Geological Society of Malaysia (GSM) was founded in 1967 with the aim of promoting the advancement of geoscience, particularly in Malaysia and Southeast Asia. The Society has a membership of about 700 geoscientists based in Malaysia as well as abroad.

Warta Geologi is published three times yearly (April, August, December) by the Society. Warta Geologi publishes peerreviewed short geological communications and original research on Earth Science. The scope includes local and regional geology, conservation geology, economic geology, engineering geology, environmental geology, geochemistry, geomorphology, geophysics, hydrogeology, palaeontology, petroleum geology, sedimentology, stratigraphy, structural geology and tectonics. Warta Geologi also reports on activities and news about GSM and the geoscience community in Malaysia.

Warta Geologi is distributed free-of-charge to members of the Society and is available free online through the Society's website: www.gsm.org.my.

GSM is committed to upholding standards of ethical behaviour at all stages of the publication process and we recommend the Committee on Publication Ethics (COPE) Best Practice Guidelines (http://publicationethics.org/resources/guidelines).

All articles published by Warta Geologi are licensed under the Creative Commons Attribution 4.0 International License. No fee is imposed on authors for publishing in the journal.

Abstract: The Kuala Lumpur Consensus on Disaster Risk Reduction was the outcome of the 2020 Asia Pacific Science and Technology Conference for Disaster Risk Reduction (APSTCDRR), documenting renewed commitment to accelerate the implementation of the Sendai Framework for Disaster Risk Reduction in four priority areas, drawing on multi-disciplinary knowledge including geoscience. The 2020 APSTCDRR offered an opportunity for science-policy interfacing to enhance the appropriate role of science, technology and innovation, facilitate the inclusion of empowered young scientists, and accentuate the integration of risk from all perspectives into planning and development at all levels. Highlights of the 2020 APSTCDRR include the status of disaster risk reduction (DRR) in the Asia Pacific, and means of addressing systemic risk including Natural Hazards Triggering Technological Disasters (NATECH) and its associated shortcomings in the region. There was also focus on climate risk and local action spotlighting the Kuala Lumpur Multi-hazard Platform, as well as youth engagement in science and technology through U-INSPIRE Alliance, an alliance of young professionals in DRR. Many of the initiatives showcased in the 2020 APSTCDRR are of relevance to the geoscience community, to strengthen their role in DRR in Malaysia and the region.

Keywords: Disaster risk, Science and Technology, Sendai Framework, science-policy dialogue, Kuala Lumpur, Malaysia

INTRODUCTION

The Sendai Framework for Disaster Risk Reduction, 2015-2030 shifts the focus from responding and managing disaster events to managing the risk of disasters (UNISDR, 2015). The shift is reflected in its four priorities, which covers understanding disaster risk; strengthening disaster risk governance to manage disaster risk; investing in disaster risk reduction for resilience; and enhancing disaster preparedness for effective response, and building back better. It also requires reliable science and technology-based disaster risk reduction (DRR) measures with innovations for a better understanding of risk from all perspectives. Evidence-based disaster risk governance is also required to ensure that risk is integrated into planning and development at all levels. Connecting science to policy is a major challenge in efforts to achieve sustainable development (McConney *et al.*, 2016). Notwithstanding, there is progress in the DRR arena particularly in the Asia Pacific, where science-policy interfaces allow for periodic linkages between scientists and policy-makers.

The Science and Technology Roadmap to Support the Implementation of the Sendai Framework for Disaster Risk Reduction was agreed upon in 2016. The global roadmap emphasizes the four priorities of the Sendai Framework and includes expected outcomes, actions and deliverables for each. Focusing on this, the inaugural 2016 Asia Pacific Science and Technology Conference for Disaster Risk Reduction (APSTCDRR) was held in Thailand, where 12 actions and cooperative mechanisms were identified for implementing the Science and Technology Roadmap 2015-2030 (APSTCDRR, 2016). The actions and mechanisms were further expanded in the Second

APSTCDRR in 2018 to 14 actions and six cooperative mechanisms in the "Beijing Consensus" (APSTCDRR, 2018). As a continuation, the third APSTCDRR in 2020 focused on how to strengthen science-based DRR policy development for building the resilience of communities and infrastructure. The 2020 APSTCDRR was hosted virtually on 15 October 2020 by the United Nations Office for Disaster Risk Reduction (UNDRR) and the National Disaster Management Agency (NADMA) of Malaysia. Key partners included the UNDRR Asia Pacific Science, Technology and Academia Advisory Group (APSTAAG), International Science Council Regional Office for Asia and the Pacific (ISC-ROAP), Integrated Research on Disaster Risk (IRDR), Asian Network on Climate Science and Technology (ANCST), Academy of Sciences Malaysia (ASM) and Universiti Kebangsaan Malaysia's Southeast Asia Disaster Prevention Research Initiative (SEADPRI-UKM).

The 2020 APSTCDRR provided an opportunity to the science, technology, and academia community in Asia and the Pacific to continue the much-needed science-policy dialogue to ensure that implementation of DRR measures is based on reliable science, technology and innovation. A total of 175 participants, comprising academics, policymakers and young professionals from 19 countries in the Asia Pacific were involved. The event also showcased successful applications of science and technology in preventing and mitigating risks for different types of hazards. The highlights of this important sciencepolicy interface are briefly mentioned in the following sections. These include the status of DRR in the region, addressing systemic risk, climate risk and local action, and youth engagement in science and technology. Many are relevant to the geoscience community, and some feature entry points for geoscience information to strengthen DRR in Malaysia and the region.

STATUS OF DRR AND SCIENCE AND TECHNOLOGY IN THE ASIA PACIFIC

Generally, implementation of the Science and Technology Roadmap in the region is good with respect to the four priority areas (Shaw, 2020; UNDRR-APSTAAG, 2020a). The progress under priority area 2 (strengthening disaster risk governance to manage disaster risk) was relatively the best among the four priorities. For this priority area, maximum progress was made in promoting disaster risk assessment in planning and development, while the least progress was made for considering root causes of risk and input from traditional knowledge for decision making. Relatively, priority area 4 (enhancing disaster preparedness for effective response, and building back better) showed the least progress and needs improvement (UNDRR-APSTAAG, 2020a). There are many issues related to integrating science and technology into DRR, particularly in the Pacific Islands

of the region. Lack of integration of climate change adaptation and disaster risk management in national policies and development plans is a major challenge. In addition, limited capacity for integration of technologies and lack of appropriate technology amongst practitioners is a barrier. This calls for increased capacity-building and training for integrating science and technology into DRR to build resilience.

The top ten innovations for linking DRR to Sustainable Development Goals (SDGs) in the region have been identified (Izumi, 2020). These include ecosystembased DRR in the livelihood sector; integrated water resources management in the water sector; earthquake guard - an early warning system; a nexus approach toward climate change, food security, and livelihoods; and a Nationalized Cluster Coordination Mechanism in the emergency response sector. Several recommendations were made to increase the applicability of innovative DRR measures. Among these were the need to reduce the huge gap between the interface of science, technology, innovation, and policymaking. In order to do this, the co-production and collaboration between researchers and practitioners have to be enhanced. Furthermore, the sharing case studies of innovations have to be intensified. It is also suggested that academia takes an additional step to improve their skills in communicating their research and its results to the public (Izumi et al., 2019).

The cumulative effect of COVID-19 has strongly impacted national and local development planning with respect to DRR and the science and technology agenda. As biological hazards have different impacts on the SDGs, it was recommended that multi-sectoral impacts be analysed to understand how sectors exacerbate the transmission of infectious diseases, and identify the health mitigation measures. For example, the information and telecommunication sector can support multiple sectors from different aspects in responding to biological hazards.

ADDRESSING SYSTEMIC RISK

The Asia Pacific Framework for NATECH (Natural Hazards Triggering Technological Disasters) Risk Management is now available to address systemic risk in the region (Chatterjee, 2020). Risks associated with NATECH have not been well documented in the region. There is no baseline available to compare risk trends. This is in part due to its low impacts prior to the large-scale 2011 East Japan Earthquake and Tsunami that triggered the Fukushima nuclear disaster. Despite increasing coverage in academia, government reports and policy documents are relatively sparse in covering NATECH risk (UNDRR-APSTAAG, 2020b). Inclusion of NATECH risks is recommended for policies, transboundary response mechanisms and agreements at the regional level. Similarly, the coverage of this aspect should be enhanced in the implementation of policy, regulation, and combination of risk assessment tools at the national level. In addition, risk assessment, awareness generation, and specialized response teams at the local level should include the risk of NATECH. The conversion of knowledge to local actions should be strengthened for NATECH risks, and this context, geoscientists have a major role to play.

The implementation of the Sendai Framework could be strengthened using a "system of systems approach" drawing on digital solutions for managing systemic risk, using wide-ranging risk analytics. The fundamental aspects of high complexity with the interaction of multiple systems need to be considered in this approach, where stochastic relationships between triggers and effects are involved. In addition, the risk is transboundary and global in nature where the systemic developments are non-linear and include tipping points. There is a need to carefully consider the complexity involved. As a solution, science could offer modelling for scenario analysis and sketching out the stochastic nature of the system. Eight steps for building a scenario of systemic risk were presented. These were (a) Scope the risk, (b) Conduct background research, (c) Frame the scenario, (d) Develop a candidate scenario, (e) Develop a narrative, (f) Assess impacts and materiality, (g) Communicate and alert, and (h) Evaluate and update. Additionally, Big Earth Data platforms for DRR and SDGs can help to fill gaps in scientific knowledge to support the achievement of SDGs. It has great potential as a digital solution for managing systemic risk.

CLIMATE RISK AND LOCAL ACTION

The readiness of ASEAN countries for a 1.5°C world is generally at a low to medium level for many aspects covering extreme events, food security and water availability, among others (Pereira & Shaw, 2022). Disaster prevention, mitigation and preparedness provide opportunities for climate change adaptation with the co-benefits of emission reduction. The integration of climate change adaptation and DRR, specifically in cities is facilitated by a system of systems approach, public-private participation with the involvement of local government stakeholders, participation of knowledgeempowered youth who offer the best potential to fill the knowledge gap, authentic community engagement, and open science communication and engagement, where community members are involved in systematic data collection and storage. The Kuala Lumpur Multi-hazard Platform was presented as a case study, to illustrate the potential for communicating local level risk through forecasting and disaster alerts in the city (Pereira et al., 2021). For climate risk-related local action, it was suggested that the challenge is to determine how many local level DRR strategies exist (Perweiz, 2020). In terms of reaching to local level, it was emphasized that "Local-action" should take place instead of localization. This means much must be done at the local level in translating such technologies into decision-making for risk-sensitive investment planning.

The Japanese experience reveals that DRR and environment and development consist of a set of issues that can be explored as scientific questions, but cannot be resolved using scientific actions alone (Koike, 2020). Therefore, the approach of "Science for Humans and Society" should be given priority. The addition of "science for discovery of social wish" was also suggested to discover and resolve social issues. This includes promoting different types of sciences as "consilience", so that science could contribute to resolve social problems as well as develop sustainably for developing "consilience knowledge base". However, there is a critical gap between scientific knowledge and social actions. To minimize that gap, an Online Synthesis System (OSS) was introduced. The functions of OSS are exploration, collection, archival, and search of scientific information in mother tongues; data integration, information fusion, prediction, simulation, and visualization; coordination of various disciplines towards consilience; mutual risk communication between society and the science community. It was recommended that the scientific community should develop the Online Synthesis System (OSS) to promote DRR and sustainable development.

YOUTH ENGAGEMENT IN SCIENCE AND TECHNOLOGY

Countries in the Asia Pacific have prioritized building skilled human capital in the field of disaster risk, as reflected by long-standing investments in national higher education and research institutions (Holloway, 2020). Higher education and research are at the forefront of grounded disaster risk knowledge, policy, and innovation, for fast tracking skilled capacity development and human resource. However, many countries in the region are still lacking in embedded institutional capability to grow their own 'scientific and educational timber'. This calls for a dual-track for strengthening skilled capacities. The first track is advocacy to bridge higher education institutions and disaster risk policy. The second track is technical integration and embedding in higher education by integrating disaster risk across a wider disciplinary and professional range, and promoting such scholarship in vulnerable countries.

The U-INSPIRE Alliance is a platform for youth engagement that was inaugurated in Indonesia in 2018 (Kathiwada, 2020). It is an alliance of young professionals, working to support DRR with the vision of developing a powerful collaboration platform for empowering youth and young professionals in DRR focusing on linking to policy at the local, national, and global levels. The Alliance has chapters in 12 countries with close to 1000 members. The major initiatives of U-INSPIRE include contributing to the status report of the Science and Technology Roadmap, Framework for NATECH Risk Management, conducting surveys on youth participation in managing COVID-19, and developing the COVID-19 Monitor. In Malaysia, U-INSPIRE is coordinated by the Special Topic Group on Young Professionals in DRR & Climate Change of the Asian Network on Climate Science and Technology (ANCST). The group has convened numerous capacity building and outreach programs, including workshops and associated events in partnership with key national and regional partners including the Geological Society of Malaysia (Muhamad, 2020). Student exchanges and information dissemination are also conducted with the support of ANCST.

Members of U-INSPIRE Alliance have developed innovative technologies. In Indonesia, a coping practice for flood disaster called "Kentongan" was introduced, which is fast and usable without electricity to send information by monitoring river water level, and can serve as a traditional early-warning tool in the face of disaster (Findayani, 2020). In Nepal, the conventional paper-based vulnerability and capacity assessment process was digitized while keeping the participatory approach intact at the community level (Gautam, 2020). Geoscience information provided in this process include hazard ranking and its historical timeline. In Sri Lanka, the community relies on kinship, relatives, and religious community to mitigate flood damages (Tsuchida, 2020). A disaster ethnographic study was conducted to identify the missing links where young practitioners and researchers play an important role in interacting with the community. This is important to prepare for future disaster events. U-INSPIRE Malaysia play an important role in providing exposure to young professional geoscientists in multidisciplinary settings (Muhamad, 2020).

CONCLUDING REMARKS

The Kuala Lumpur Consensus on DRR was the outcome of the 2020 APSTCDRR. The Kuala Lumpur Consensus renewed the commitment to accelerate the implementation of the Sendai Framework for Disaster Risk Reduction to achieve the goals of sustainable development and resilience. The Consensus recommends 14 actions and six cooperative mechanisms to the global "Science and Technology Roadmap", and sets the pathway for strengthening the four priority areas of the Sendai Framework drawing on multi-disciplinary inputs including geoscience. A multi-hazard approach is key for improving understanding of disaster risks, specifically emerging climate risks, exposure, vulnerability, and public health threats. This also includes risks of transboundary, cascading, biological, technological, environmental, and NATECH disasters. Enhanced disaster risk governance requires improvement in transdisciplinary engagement between scientists, policymakers, civil society, and businesses at all levels. Other important elements include strengthening science-based decision making, considering future risk, and promoting local and traditional knowledge, including land-based solutions.

Priority actions to increase investment DRR for Resilience covers knowledge, education, research, innovation, technology transfers, and the empowerment of youths and young professionals, to advance multidisciplinary disaster risk reduction and build resilience. In order to enhance disaster preparedness for effective response and to build back better, the priority is to develop and disseminate information on multi-disciplinary science, technology, and innovations for effective predisaster planning, preparedness, response. The element of regular outreach programmes to connect with the most vulnerable groups in exposed areas is critical in this context. Implementation of the Kuala Lumpur Consensus requires cooperation on strengthening transdisciplinary actionoriented research and education, and engagement in disaster risk science, technology, and policy. Non-government organisations also have a role in advancing science and technology drawing on Local and Indigenous knowledge to support decision-making. Enhancing the inclusion of science and technology groups, including youths and young professionals, and stakeholder groups in DRR activities and policy platforms is also important. Efforts are required for increasing investment from governments, societies, businesses and other stakeholders in research, capacity building and development of DRR science and technology. In Malaysia, the Geological Society of Malaysia (GSM) can play a leading role in garnering support from universities, government, businesses and other stakeholders, around innovation, partnership development, international cooperation and exchanges on science and technologybased DRR. There is also much to be done in translating into actions the "whole of Government" and "whole of Society" approaches in DRR, and the GSM is well positioned to support this endeavour.

ACKNOWLEDGEMENT

The team at SEADPRI-UKM and the Academy of Sciences Malaysia coordinated by Mr. Mohd Khairul Zain Bin Hj. Ismail is thanked for their technical support in organizing the 2020 APSTCDRR online. The guidance of Dr. Animesh Kumar of the United Nations Office for Disaster Risk Reduction (UNDRR) in convening the event is also gratefully acknowledged. The authors also extend their deepest gratitude to all conference partners, speakers, moderators and participants, as well as the manuscript reviewers for their contribution.

AUTHORS CONTRIBUTION

JJP – conceptualisation, writing and editing; TRB – writing and editing; NM – information curation, review and editing; SY – review and editing; and SY and RS – review and editing.

Geological Society of Malaysia Publications

Instruction to Authors

GENERAL POLICY

Papers should be as concise as possible. They may include original results of basic, applied and policy research of national or international significance, current reviews, or discussions on techniques, research programs, organisations, information, or national and international policies in geoscience.

SUBMISSION OF PAPERS

Only papers that have not been published elsewhere (except those in the form of abstracts, published lectures or academic theses), including electronically, will be considered for publication. Authors must agree not to publish elsewhere the submitted or accepted articles in the same form, in English, Malay or other languages. Originality detection services may be used to check your manuscript to verify its originality.

All papers will be subjected to review by two or more reviewers. Authors wishing to include published and unmodified figures or text passages are required to obtain permission from the copyright owner(s). Authors of English papers are strongly urged to have their manuscript edited for language before submission by a person whose first language is English.

The Editor reserves the right to reject all or any part of the paper submitted. The Geological Society of Malaysia assumes no responsibility for statements made by authors.

The paper should be submitted to:

The Editor, Geological Society of Malaysia c/o Department of Geology University of Malaya 50603 Kuala Lumpur, Malaysia Tel: (603) 7957 7036 Fax: (603) 7956 3900 Email: geologicalsociety@gmail.com

MANUSCRIPT

The paper can be written in Bahasa Malaysia (Malay) or English. For English papers, use either British or American spelling but not a combination of both. The paper should be checked thoroughly for spelling and grammar. The manuscript must be printed at 1.5 spacing in a single column on one side of A4 paper. All pages should be numbered. Length of paper should be between 3,000 and 8,000 words for the Bulletin and between 2,000 and 3,000 words for Warta Geologi, excluding tables and illustrations. Metric units should be used and all non-standard symbols, abbreviations and acronyms must be defined.

TITLE

Title must be informative and reflects the content of the paper. Title in Malay should include an English translation. It should be concise (less than 20 words). Avoid using abbreviation in the title.

AUTHOR'S ADDRESS

Addresses of all authors must be provided. The addresses should be sufficient for correspondence. Please include email address, telephone and fax of the corresponding author.

Abstract

Abstract should not exceed 300 words. Articles written in Malay language should also be accompanied by English language abstracts and keywords.

Keywords

Please include 3 to 8 keywords that best describe the content of the paper.

References

In the text, references should be cited by author and year and listed chronologically (e.g. Smith, 1964; Jones et al., 1998; Smith & Tan, 2000). For both Malay and English paper, all references must be listed in English. Title of non-English articles should be translated to English.

The list of references should only include articles cited in the text. The list should be arranged in alphabetical order. Please ensure that the reference list is complete and the bibliographical details are accurate. The references should be in the following manner:

Journal article:

Suntharalingam, T., 1968. Upper Palaeozoic stratigraphy of the area west of Kampar, Perak. Geol. Soc. Malaysia Bull., 1, 1-15.

Book:

Hutchison, C.S., 1989. Geological Evolution of South-east Asia. Clarendon Press, Oxford. 368 p.

Chapter of book and Symposium volume:

Hosking, K.F.G., 1973. Primary mineral deposits. In: Gobbett, D.J. and Hutchison, C.S. (Eds.), Geology of the Malay Peninsular (West Malaysia and Singapore). Wiley-Interscience, New York, 335-390.

Article in Malay:

Lim, C.H. & Mohd. Shafeea Leman, 1994. The occurrence of Lambir Formation in Ulu Bok Syncline, North Sarawak. Geol. Soc. Malaysia Bull., 35, 1-5. (in Malay with English abstract)

TABLES

All tables should be cited in the text and numbered consecutively. Tables should have a title and a legend explaining any abbreviation or symbol used. Each table must be printed on a separate piece of paper. Do not insert the tables within the text. Data in tables should be aligned using tab stops rather than spaces. Avoid excessive tabulation of data.

ILLUSTRATIONS

Please make sure that all illustrations are useful, necessary and of good quality. A maximum of ten (10) illustrations (photographs, graphs and diagrams) are allowed and these should be cited in the text and numbered consecutively as Figures. The papers are usually published in black-andwhite but it may sometimes be possible to include colour figures at the author's expense. The scales for maps and photomicrographs should be drawn on the figure and not given as a magnification. Originals should not be greater than A4 size and annotations should be capable of being reduced down to 50 percent. The caption should be listed on a separate piece of paper. Do not insert the illustration within the text.

SUBMISSION OF ELECTRONIC FILES

Authors are required to submit electronic files in a CD-ROM or email as attachments. The submission should be accompanied with a listing of all files and the software (name and version) used. The file names should reflect the content of the files (e.g. Ali_Fig1.tif). Please make sure that the files and the hardcopies are the same.

PREFERRED SOFTWARE

Text: Microsoft Word. Do not insert tables and illustration within the text.

Tables: Microsoft Word or Microsoft Excel. Please submit as separate files.

Illustrations – Vector Graphics: Adobe Illustrator (preferred), CorelDraw and Freehand. Final line thickness should be at least 0.5 point or 0.17 mm. For other software, please submit one copy in the native file format and export one copy as a PDF file with all fonts embedded and one copy as a high resolution TIFF or JPEG image.

Photographs or bitmap (raster) images: Adobe Photoshop. Please save as TIFF or PSD files. Save/scan line art at 600 to 1200 dpi and greyscale figures at 300 to 600 dpi. High resolution JPEG, TIFF or GIF files from other sources are also acceptable. The resolution must be high enough for printing at 300 dpi.

WARTA GEOLOGI PERSATUAN GEOLOGI MALAYSIA

Jilid 49, No. 1 • Volume 49, No. 1 • April 2023

KANDUNGAN (CONTENTS)

CATATAN GEOLOGI (Geological Notes) HARRY DOUST : Does the Caribbean hold lessons for SE Asia? Part 2 1 FRANZ-LUITPOLD KESSLER : The sea level rose fast, but Sarawak was rising faster 8 **CATATAN LAIN (Other Notes)** Joy Jacqueline Pereira, Tariqur Rahman Bhuiyan, Nurfashareena Muhamad, Saini Yang, RAJIB SHAW : Advancing science, technology and innovation for disaster risk reduction: The Kuala Lumpur Consensus on Disaster Risk Reduction 14 PERTEMUAN PERSATUAN (Meetings of the Society) MOHD NAWAWI MOHD NORDIN : Electrical imaging and geophysical method for subsurface mapping 19 CHARLES MAKOUNDI : Hydrothermal fluid and significant in exploration and ore genesis 20 MUHAMMAD HAFEEZ JEOFRY : Radio-echo Sounding (RES) profiling and numerical modelling 20 MOHD HARIRI ARIFIN : UKM Geophysics: Past, present and future 21 AZLAN BIN ADNAN : Geological aspects in earthquake engineering 21 XIONGWEI NIU : New ocean bottom seismometer exploration for crustal imaging in Arctic Ocean 2.2 AHMAD NIZAM HASAN : Engineering geological challenges in urban development : From conventional to unconventional approach 23 STEFAN HERWIG GÖDEKE : Groundwater investigation: Fundamental & application 24 JOHN KUNA RAJ : Characterizing weathering profiles in Peninsular Malaysia 24 **BERITA-BERITA PERSATUAN (News of the Society)** Acknowledgement to Peer Reviewers (2022) 27 Laporan Persidangan GEOSEA 2022 28 Report : Perbincangan Intelek: Perspektif geologi kejuruteraan terhadap kejadian terkini tanah runtuh 30 Batang Kali Report : Geological Society of Malaysia Karst Working Group and Malaysian Cave and Karst Conservancy educational excursion to Batu Caves 31 New Membership 32 **BERITA-BERITA LAIN (Other News)** GSM-UMS Geology Club program December 2022 report 34 GSM-UMS Geology Club program January 2023 report 36 Laporan Ceramah Teknik 38 Upcoming Events 43
